

1. Basic Information

Name of the Institution: Schoolvision BV, operating under the trade name Team Academy (hereafter "Team Academy throughout the dossier"), it offers the accredited Bachelor of Business Administration in Entrepreneurship, registered under Isat 30117 in the Central Register of Higher Education Programmes (CROHO). The Bachelor of Business Administration in Entrepreneurship has been accredited by the Accreditation Organisation of the Netherlands and Flanders (NVAO) since May 2015.

Name of the programme: Professional Master's in Applied Artificial Intelligence (AI)

Degree awarded: Professional Master's

Orientation & level: Professional Master, NLQF/EQF Level 7

Mode of delivery: Full-time on campus and Part-time online

Location(s): Vlaardingenvaan 15, 4th floor 1062 HM Amsterdam

Language of instruction: English

Number of students (expected): 25 students for full-time and 15 students part-time programme

Responsible faculty/department: Team Academy Amsterdam Technology Department

2. Structure of the Information Dossier

- Brief description of how the dossier was compiled:

This Information Dossier was compiled through a structured, step-by-step process coordinated by an internal accreditation team with expertise in curriculum and programme design. The team first prepared initial drafts of the core programme documents such as the target exit profile, programme orientation, and main competencies in close collaboration with faculty. In parallel, a dedicated working group designed and developed the assessment structure in consultation with the Examination Board.

As the drafts were being created, the accreditation team conducted iterative coherence checks to ensure alignment between intended learning outcomes, programme design, and assessment. Throughout this process, all materials were systematically validated against the WHW, NVAO, and NLQF-7 standards. As we reviewed documents, we integrated evidence such as appendices, sample assessments, and other supporting materials to ensure the dossier is complete and verifiable. Finally, the entire dossier underwent a comprehensive quality check and internal validation to confirm accuracy, consistency, and compliance before submission.

- Involvement of staff and professional field:

The development of this dossier was the result of coordinated collaboration between internal stakeholders, representatives from the professional field, and the management team. The internal accreditation team facilitated and structured the engagement of all parties to ensure quality, coherence, and alignment with NVAO standards.

Faculty & Staff:

Faculty and educational staff contributed extensively to reviewing and validating the curriculum structure, the coherence of learning lines, module-level learning outcomes, and the alignment between learning outcomes, learning activities, and assessments. Their iterative input ensured that the programme design remained pedagogically consistent and professionally relevant.

Examination Board:

The Examination Board played a key role in shaping the assessment framework, advising on validity, reliability, and alignment with the learning outcomes. They provided advice on the programmatic assessment structure and ensured compliance with institutional and NVAO standards.

Professional Field:

Representatives from the professional field including practitioners and domain experts provided feedback on the professional relevance of the curriculum. Their insights helped verify that the curriculum corresponds to labour market expectations, emerging industry trends, and the competencies required for advanced professional practice.

The Management Team:

The Management Team including the Managing Director and the Executive Board played a strategic and enabling role throughout the development of this dossier. They provided the strategic direction, ensured the allocation of appropriate resources for the preparation process, and contributed input and validation at key stages. Their role safeguarded alignment with Team Academy's mission, educational philosophy, and long-term institutional priorities, which ensured that the dossier reflects organisational commitment to quality.

This integrated involvement of internal staff and professional field partners ensures that the programme and its intended learning outcomes are aligned with contemporary professional standards, safeguard academic quality, and embody our practice-oriented educational philosophy.

Standard 1: Intended Learning Outcomes

The intended learning outcomes correspond to the level and orientation of the programme and are aligned with the expectations of the professional field and the academic discipline, as well as with international standards. The intended learning outcomes demonstrably reflect the level (associate degree, bachelor's or master's) as defined in the Dutch Qualifications Framework and the orientation (higher professional education or academic education) of the programme. They are furthermore aligned with current requirements regarding programme content from regional, national and international perspectives, as expressed by the professional field and the academic discipline. Where applicable, the intended learning outcomes also comply with relevant laws and regulations.

Schoolvision BV, operating as Team Academy University of Applied Sciences (hereafter “Team Academy throughout the dossier”), has operated as an accredited institution since its initial accreditation in September 2015. Since then, the institution has successfully completed the required six-year reaccreditation cycles for its Bachelor’s in Entrepreneurship, a programme that embodies the institution’s distinctive educational philosophy: *learner-centred, experiential, guided self-organised, and grounded in real-world practice*.

Drawing on a decade of experience in practice-based education, Team Academy now seeks to expand its educational portfolio with technology-oriented professional master’s programmes. This development represents both a natural evolution and a strategic response to societal needs. The institution aims to transfer its proven educational know-how, particularly in experiential learning, and coaching-based learner development, to the master’s level.

Introducing technology-oriented professional master’s programmes alongside its entrepreneurial bachelors Team Academy intends to respond to the following challenges within the European education and job market:

- The digital economy makes traditional jobs redundant while creating the need for new ones in the age of artificial intelligence.
- The resulting skills mismatch occurs as traditional educational institutions are failing to provide on-demand skills in the job market.
- The need for a full-stack educational offer where job-ready digital skills are powered with recognised credentials.

In response to these challenges, Team Academy aims to close the gap between the academic world and the labour market in tech-oriented fields, such as artificial intelligence and data science. To this end, Team Academy offers

- a technology-focused professional master’s programme that integrates action research with an inquiry mindset,
- competency-based education to bridge the talent gap created by the above-mentioned skills mismatch.

- a vibrant campus environment in Amsterdam.

Team Academy, in line with its guided self-organised, practice-led learning philosophy, now seeks first-time accreditation for its Professional Master's in Applied Artificial Intelligence. The programme has the following professional-orientation objectives:

- to help each participant develop an applied understanding of the approaches, techniques and technologies in AI and data science to solve any data problem with a practitioner-researcher mindset;
- to help each participant gain hands-on experience in building AI and data science projects to develop a business mindset for better employability.
- to help each participant enhance leadership skills through an action research inquiry mindset, moving from self-leadership to organisational impact.

In line with these objectives, the Professional Master's programme has formulated four programme outcomes. The programme outcomes of the Professional Master's in Applied Artificial Intelligence come from a review of current developments in AI and data science. Continuous attention is paid to the demands and needs of the professional field to ensure that the curriculum is up-to-date and aligned with (international) professional needs and frameworks such as EDISON, from which we benefited to establish a life-cycle model from designing to optimising models. In our opinion, a Professional Master's in applied AI should be able to work in a self-directed and autonomous manner on complex problems, integrating data from different areas, applying leadership skills (e.g effective listening, collaboration, creating an impact) to ensure that the Data Science & AI projects are carried out effectively, efficiently and successfully in a modern working environment.

Therefore, a graduate from the Professional Master's in Applied AI needs to be skilled in the AI life cycle and effective leadership, especially in a multidisciplinary setting. How the programme objectives are connected to the Professional Master's standards, the Netherlands Qualifications Framework (NLQF) and the Dublin Descriptors can be seen in [Appendix 1](#):

1. **Mastery:** Graduates demonstrate mastery of Applied AI by acting autonomously and ethically in complex and uncertain contexts, reflecting critically on their personal leadership practice, and integrating responsible AI principles into professional decision-making.
2. **Research Competence:** Graduates are able to design and conduct practitioner research that frames business problems into AI solutions, analyse and model data with advanced techniques, and generate insights through cycles of inquiry and reflection, which contributes to fresh thinking and applications in their professional practice.
3. **Interprofessional Conduct:** Graduates collaborate effectively across disciplines and organisational levels, facilitating dialogue and interventions in diverse professional and cultural contexts, and communicating complex AI concepts and research outcomes clearly to both specialist and non-specialist audiences.

4. **Effect:** Graduates deliver measurable impact in their professional practice by deploying AI systems in organisational settings with a sense of responsibility, transferring knowledge across domains, and helping to shape future-oriented strategies that have an impact on their work and communities.

The programme addresses these outcomes through two sets of competencies and aims to equip every participant with these two learning lines (1) applied artificial intelligence (2) applied action research. These target competencies in each learning line were designed and validated using multiple means and methods (please see [Appendix 2](#)) based on (1) *desktop research to identify the needs of the job market*, (2) *Benchmarking with other programmes* (3) *workshops with faculty to review and finalise the competency set*, and (4) *external validation with industry experts*.

As said, this competency profile of the programme is heavily driven by the needs of the industry and the increasing number of individuals seeking applied AI and data science roles in the job market. The immense volumes of data and rapidly advancing AI technologies are now taking over the world and changing the way we understand business, people and their behaviours. Organisations from the sciences to healthcare, from finance to the Internet are trying to make sense of the AI technologies and data science, and they are on the lookout for skilled people to help lead their business.

Roles like Artificial Intelligence Engineer and Machine-Learning Engineer are consistently highlighted by LinkedIn as among the fastest-growing and most in-demand globally. They are at the very top of their growth lists in many countries. The World Economic Forum's 2023 Future of Jobs Report projects a 40 % net increase in demand for AI & ML specialists and a 30 % increase for Data Analysts and Scientists by 2027. The situation is no different in the Netherlands. Dutch labour-market data (CBS, AI Monitor 2024) shows a sustained elevation in AI-specialist demand and a structural shortage concentrated at the advanced-skills tier. Organisations cite lack of applied AI experience as the primary barrier to adoption.

Standard 2: Teaching and Learning Environment

The curriculum, the teaching and learning environment, and the quality of the teaching staff enable incoming students to achieve the intended learning outcomes. The intended learning outcomes are adequately translated into learning objectives for the (components of the) curriculum. The diversity of the admitted student population is taken into account. The lecturers are sufficiently qualified, both in terms of subject matter and didactics, to deliver the programme and provide guidance. The teaching and learning environment encourages students to actively engage in shaping their own learning process (student-centred learning). If the programme is delivered in a language other than Dutch, the programme justifies this choice. This also applies if the programme uses a non-Dutch name. Lecturers demonstrate sufficient proficiency in the language of instruction. Facilities are not assessed unless they are specific to the programme in question.

2.1 The Curriculum Orientation

As stated under Standard 1, within the Professional Master's in Applied AI at Team Academy, a *competent learner* profile should involve the following:

- (1)** Applied AI competencies (as part of Applied AI Learning Line): Business Problem Framing, Exploratory Data Analytics, Machine Learning Modelling, Deep Learning, Computer Vision, Responsible AI, Natural Language Processing, Large Language Models, Retrieval Augmented Generation Implementation, Machine Learning Operations in Cloud
- (2)** Applied Action Research competencies (as part of Applied Research Line): Self-leadership Inquiry, Interpersonal Leadership Inquiry, Organisational Leadership Inquiry, Research Methodology for Professional Practice

More information on the learning lines that clearly outline our curriculum orientation can be found in [Appendix 3](#)

The programme aims to develop a typical “T-shaped” researcher who can combine their deep expertise in AI and data science with action research methodology to formulate interdisciplinary solutions. While AI and data science help professionals develop sound and practical solutions to relevant challenges, the practitioner research focus enables them to develop an inquiry mindset and leadership enhancement. In this sense, the action research methodology used in the programme contributes to developing the T-shaped AI and data science professionals with a cross-functional research capacity.

Action research is a structured, cyclical process in which professionals identify a real-world problem in their workplace, design and implement a practical intervention, collect evidence on its effects, and then reflect critically to refine both their solution and their own practice. Because it combines rigorous inquiry with immediate application, action research aligns perfectly with the programme's

goal of producing T-shaped AI and data-science professionals who can bridge theory and practice, drive measurable improvement in their organisations, and continuously learn from evidence-based reflection.

The Professional Master's in Applied AI programme promotes internationalisation; incorporating an international and intercultural dimension into the context of curriculum and the community. To this end, the programme aims:

- to develop graduates and staff as global learners, individuals and professionals;
- to prepare graduates to act responsibly and sensitively in international and multicultural contexts.

Some of the ways to achieve the internationalisation in the programme are:

- promoting and bringing together a student population from different parts of the world;
- employing international staff, from faculty to administration, to provide teaching and a teaching environment at international standards;
- exposure to globally acclaimed content libraries in the curriculum.

To achieve all this, the curriculum orientation has two main learning lines described earlier in [Appendix 3](#).

2.2 Curriculum content

The general curriculum for the Professional Masters in Applied AI is laid out in [Appendix 4](#), but please also check [Appendix 5](#) for the detailed module descriptions. As mentioned under Standard 1, in line with the programme objectives, the Masters programme has formulated four overall programme outcomes: (1) *Mastery* (2) *Research Competence* (3) *Interprofessional Conduct*, and (4) *Effect*. Table 2 in [Appendix 1](#) shows where and when these programme outcomes come back in the different programme modules. There is a direct link between what the programme intends to achieve and the curriculum. This is reflected in the modular structure where each module aims to focus on one area while the final project the applied AI skills and practical action research that facilitates leadership development.

As part of the competency-based learning model and programmatic assessment, the curriculum is supported by practical assignments and projects linked with specific learning outcomes. And the participants are provided with information regarding the target learning outcome that is assessed in a specific assignment and an evaluation rubric to reach the intended competence profile of the programme. More information can be found in the Assessment section later.

2.3 Learning Environment / Learning Model

The structure of the curriculum encourages study and enables students to achieve the intended learning outcomes. These are the main pillars of the learning environment:

Learner-centred educational model

The programmes at Team Academy are based on experiential learning which focuses on active and first-hand involvement in the learning experience rather than passively listening to a lecture. Experiential learning emphasises experimentation, individual and social sense-making as well as reflection. In line with this learning model, all modules are supported with certain learning accelerators such as workshops, hands-on individual and team projects as well as team coaching and supervision for the final projects. The participants prove learning mastery through their performance

in the assignments and projects in each module. There is also a balance between self-paced individual and team activities. AI and data science fields are quite practical in nature, and research shows that this experiential model - learning by doing - has been found to promote better retention of learning (Kokcharov, 2015).

Learning is enhanced by interactive workshops where learners actively participate in discussions and hands-on practice. Learning materials are augmented by interactive digital content through which learners can actively engage with an extensive digital library at their own time; learning outcomes are achieved by assignments and module projects in which learners can practically apply their skills in real-life contexts. Additionally, they are surrounded by a peer support group in their team projects and expert support in the form of team coaching, all of which make the learning environment highly student-centred.

Team coaching and peer learning

Peer-learning plays a crucial role in the programme experience in terms of student-centred learning. It works in a variety of ways. One of them is team coaching, which is a dialogical and experiential process that supports collective learning and performance. The weekly team coaching sessions bridge learning with professional practice through reflection, dialogue, and experimentation. The coach facilitates inquiry and ownership rather than providing instruction, which enables the cohort to apply knowledge to real-world challenges while developing autonomy, adaptability, and collaboration.

Modular Structure of the Curriculum

The curriculum has been designed in a modular structure in which the modules complement each other and build upon each other by the curriculum team. Each module helps participants acquire knowledge and skills to fulfil the intended academic level of the programme, which is geared towards job-ready skills and portfolio development in AI and data science. Each module contributes to the development of the competences through the following learning activities:

- **Weekly Workshops:** Focused sessions targeting specific topics and learning outcomes aligned with the module and programme-level competencies.
- **Curated Digital Content:** High-quality, targeted digital resources that support self-paced learning and contribute directly to competency development.
- **Weekly Assignments and Module Projects:** Practical and applied tasks designed to assess student progress toward achieving the targeted competencies at both the module and

certificate levels.

- **Peer Study Groups:** Collaborative spaces where students engage with each other's perspectives, enhancing their understanding through dialogue and mutual support.
- **Team Coaching:** Structured coaching sessions aimed at fostering shared knowledge creation, social learning, and reflection on team dynamics and leadership practices.
- **Research Supervision:** Ongoing support from action research supervisors to guide students in their application of inquiry and practitioner research skills throughout the programme.
- **VIVA meetings:** They serve as high-stake decision points within the programmatic assessment framework, validating the learner's achievement of learning outcomes and readiness for progression. Held at the end of each certificate phase, a panel of three examiners evaluate the learner's portfolio and reflections through a structured dialogue focused on learning outcomes and professional autonomy. Based on this evidence, the panel issues a holistic decision - Progress, Conditional Progress, or Hold to ensure transparent and consistent progression aligned with master's-level standards.

Workload and credits

A typical weekly learner workload for full time and part time programmes can be found in the Detailed High Level Curriculum document/[Appendix 6](#). The weekly workload in the full time is approximately 40 hours/week on average while the part-time has 21 hours/week; depending on the module and the pace of the learner this can vary for sure. The value of one credit is equivalent to 28 hours based on ECTS. The workload in the modules is calculated based on the average of the working hours required to complete all the weekly learning activities mentioned above.

Please see [Appendix 7](#) (Educational Handbook) for more information on the learning model as well as the assessment system (more in standard 3), learner support system and other general procedures in the programme.

2.4. Admissions

The admission process of the professional masters programme has been designed in a way that ensures the possibility of meeting the intended outcomes of the programme. It is based on the premise that incoming students should have a reasonable chance of successfully completing the programme within the duration of the programme). We aim to have an alignment with this standard, in accordance with the Dutch law¹.

The Professional Master's in Applied AI admission process consists of the following structured steps. All this information is made available in [Appendix 8](#) (Programme Brochure) as well.

1. Basic Entry Requirements; all candidates must meet these:

- Bachelor's degree (from an accredited institution)
- English Proficiency: C1 (proof required, IELTS, TOEFL, or equivalent)

¹ Article 7.30, paragraph 2 Toelatingseisen masteropleidingen

- **Motivation and Commitment:** Demonstrable interest in artificial intelligence and leadership; commitment to invest approximately 40 hours per week for full-time study, and approximately 20 hours per week for part-time study.

2. **Application Submission:** Candidates submit an online application form, including the following documentation:

- Academic diplomas
- Relevant certifications (if available)
- Updated CV highlighting education and relevant professional experience

Please see the application form [here](#).

3. **Initial Intake Interview:** during which the Admissions Consultant assesses:

- Candidate's overall motivation and fit for the programme
- General communication skills and readiness for graduate-level online education
- Verification of previous education, specifically identifying evidence of:
 - intermediate-level programming skills (preferably in Python)
 - fundamental knowledge of mathematics and statistics

4. **Enrolment in preparatory module*:** Candidates will enrol in a structured foundations module tailored to ensure readiness for the professional master's degree. After successful completion, candidates transition into the main programme. If the candidate wishes to waive this foundations module, they can always take a proficiency assessment before their enrollment. The proficiency assessment has two components:

- An online test that covers questions on the following topics:*
 - Basic Python programming
 - Basic mathematics and statistics fundamentals
 - Leadership awareness
- A follow-up call by the key faculty after the results of the online test to review and validate the assessment results.

5. **Decision & Recommendations (for those who have taken the test):** The key faculty members make a final decision based on the candidate's cumulative performance:

- **Admission to the Main Programme:** the candidate demonstrated adequate competencies and readiness for direct enrolment.
- **Conditional Admission:** faculty recommend enrolment in a Preparatory programme designed to bridge gaps in skills (programming, statistics and/or leadership).

**Preparatory Module (Module 0) as a Bridge for Academic Readiness*

To ensure that the programme remains accessible to a diverse range of applicants while safeguarding its academic rigour at NLQF 7 / master's level, the Professional Master's in Applied AI includes a structured Preparatory Module (Module 0). This module will function as an essential bridging programme for candidates who show strong motivation and potential but require reinforcement in foundational areas such as Python programming, statistical thinking, and leadership awareness before beginning the master's curriculum. Delivered over nine weeks in a flexible, online, and self-paced format, Module 0 provides approximately 50 hours of targeted learning supported by weekly live group mentoring. Candidates build essential coding skills (including control flows, data structures, functions, Git workflows), strengthen their understanding of probability and hypothesis

testing, and develop initial leadership sensitivity (e.g., awareness of leadership types and power relations in organisations). Completion of the preparatory project is required for progression into the main programme. By offering this structured readiness pathway, the programme ensures an equitable entry route for students from varied educational and professional backgrounds, while simultaneously maintaining the high-level starting point expected of a professional master's degree. This design supports student success, contributes to study feasibility, and ensures that all learners commence the programme with a shared baseline of competencies aligned with the curriculum's more advanced learning outcomes.

2.5 Faculty & Staff

Faculty Composition and Roles

The Professional Masters in Applied AI is delivered by a diverse team of local and international faculty members who bring together deep knowledge and professional expertise in the fields of AI, data science, and leadership. This diversity enhances both the global and applied character of the programme. An overview of faculty members and programme staff is included in [Appendix 9](#).

The faculty includes workshop facilitators, team coaches, assessors, and supervisors. We also have the members of the Examination Board who safeguard the quality of assessments. This structure ensures that students receive consistent learning support, real-world insight, and diverse perspectives throughout their learning journey. Faculty members involved in assessments are formally appointed by the programme's Examination Board in accordance with institutional policy.

Detailed descriptions of the faculty role can be found in the [Appendix 18](#).

Professionalisation

At Team Academy, we try to encourage and facilitate our staff to continuously improve their subject content and teaching and assessing skills, as we know this is the best way to ensure our learners are taught and assessed at an appropriate Professional Masters level.

To start with, we have identified faculty competencies required to teach in the programme as follows:

- Academic Qualification and Industry Experience
- Interpersonal Skills (+ English proficiency at least in C1)
- Commitment to Continuous Learning & Learning Agility
- Curriculum Design and Development
- Facilitative Teaching & Supervision Approach
- Competency-Based Assessment
- Contributing to the Organisational Level
- Mentoring & Leadership

Furthermore, below is the set of competencies expected from the officially appointed assessors:

- Designing Assessments
- Developing Assessments
- Administering Assessments
- Grading and Evaluation
- Feedback & Feedforward
- Analysing Assessment Data

- Revising Assessments
- Continuous Professional Development

Additionally, the assessors are required to complete a Massive Open Online Course (MOOC) by Erasmus University on assessment in higher education, which has similar learning outcomes as the Dutch 'Basis Kwalificatie Examinering.

To ensure professionalisation from the start, we have outlined an onboarding process for the faculty members where they go through a set of steps from the selection to their orientation and professional development process. More details can be found in [Appendix 22](#).

Team Academy promotes continuous faculty development through an inquiry-driven professionalisation model. To maintain their professional development, we have a professional development plan in place that reflects our shared leadership qualities: accountability, courage, care, collaboration, and participation. Faculty are offered opportunities to grow in areas such as assessment design, facilitative teaching, curriculum co-creation, and student feedback practices. This model follows a cyclical approach involving goal setting, experimentation, reflection, and peer learning, which is facilitated through professionalisation circles where faculty are encouraged to reflect on their growth together in line with the required competencies and take meaningful actions to enhance their skills collaboratively. It aligns with our institutional values of shared leadership, collaboration, and innovation, as outlined in the Leadership Manifesto (can be found in the Educational Handbook). The current professionalisation plan is detailed in [Appendix 10](#).

Faculty Research Expertise

Faculty demonstrate active engagement in research that advances both academic and professional knowledge in data science, artificial intelligence, and leadership. Their work directly informs curriculum development and ensures the programme remains research-informed and industry-relevant. Further information about faculty research interests, outputs, and links to publications is available in [Appendix 11](#): Faculty Research Portfolio

Programme Team and Roles

The implementation and delivery of the programme are supported by a dedicated Programme Management team. Their key responsibilities include:

- Operational coordination and implementation of the learning journey
- Liaison between learners and faculty
- Organisation of community engagement activities (e.g. Town Halls)

In addition, the Learning Design and Development Lead, with a background in education and learning technologies, works closely with the programme team and field representatives to design, develop and continuously improve curriculum content and instructional design.

Field Representatives and External Input

We also collaborate with Field Representatives from the data science and AI industry who provide structured input into curriculum design and relevance. Their role is to ensure the learning outcomes remain aligned with industry needs. More information on the composition can be found in [Appendix](#)

9. And, in this [Appendix 20](#), you can also find the main responsibilities of the field representatives and the guidelines for how we envision we will work together.

Supervision of Supervisors

To strengthen the programme and ensure consistent quality in the guidance of learner research, experienced senior supervisors will provide support and mentoring to faculty involved in supervising action research projects. This supervision aims to enhance supervisory practice and further increase the quality of the graduate projects.

Examination Board

The Examination Board, chaired by an SKE-qualified professional, ensures the quality and integrity of assessments and final qualifications. It currently consists of an external chair, two internal members, and a secretary. The Board's responsibilities and operating principles are detailed in [Appendix 12](#).

Organisational Structure and Roles

The broader organisational structure of Team Academy is outlined in [Appendix 13](#), with specific role descriptions.

2.6 Digital Infrastructure & Campus

Learning and teaching environment

The learning and teaching environment has been built on top-notch digital platforms where every learner has seamless access to all educational resources, materials, activities, assignments and online events. These digital platforms consist of the learning management system as well as the communication and interaction tools helping to keep all resources and materials organised. The programmes are planned to be delivered on the institute's Learning Management System built on Canvas LMS. Communication systems (e.g. chat bots and instant messaging platforms such as Slack) are in place for an efficient flow of communication between all community members including learners, management teams, boards, faculty and employer partners. Online synchronous interactions (e.g. online workshops) are planned to be conducted on live video conferencing tools allowing for group interaction and participation such as Zoom and Google Meet.

Learners will have access to a digital content library consisting of a variety of learning resources in the programme. Each module in the programme will be supported by a large content library of videos and books, industry-relevant projects and teaching materials during the online workshops. The content library is composed of several online learning platforms such as Datacamp and curated materials by faculty.

Apart from the digital learning environment, Team Academy will use its campus in Amsterdam for the full-time programme experience. The physical environment allows for ample space and opportunities for students to interact with one another and faculty.

Both at Team Academy in general and in this programme, English is used as the main language to work, communicate and educate. The requirements set by the professional field and the international background of the institute make this an obvious choice. Furthermore, we believe that educating our future Masters graduates in the language they will be most likely to need most in their career, will

add value as they become more fluent and more effective in their communication in a (for most of them) foreign language during their education.

2.7. The tutoring of and provision of information

The Professional Masters in Applied AI offers learning support and assistance in a systematic and practical way to enhance academic achievement levels and to meet the learning needs of the students. This support and assistance mechanism is provided in several different ways.

- Facilitation replaces traditional teaching or lecturing in the programmes. It helps learners digest topics, share and discuss ideas and practice hands-on skills in the workshops.
- Team Coaching plays a vital role in the programme participants' academic achievement. It is a dialogical and experiential learning process in which a coach facilitates the collective development of a team to enhance learning, leadership, and performance. It focuses on enabling students to reflect, act, and learn together while addressing real-world, complex challenges. The coach does not direct or instruct but creates conditions for inquiry, ownership, and purposeful action. This is supported by tools such as individual and team learning contracts, weekly team training sessions, and peer feedback;
- Research Supervision is a structured and critical element of the programme for the final projects. Students are assigned a supervisor with expertise in AI&Data Science, and Action Research, who guides them through the full action research cycle. Supervisors play a key academic role in ensuring the rigor, coherence, and depth of the student's inquiry and implementation. Their responsibilities include reviewing the project proposal and plan, advising on methodological soundness, and supporting the ethical and practical dimensions of the project. Throughout the process, supervisors ensure that the final project meets the standards of a professional master's degree, aligned with the NLQF level 7. Supervision meetings and milestone reviews are held to help students remain on track and reflect on their leadership development and technical decisions. Supervisors also provide formative feedback at various stages and prepare students for the summative assessment conducted at the end of the programme.
- Assessors ensure academic standards by assessing assignments, projects, and final deliverables using rubrics aligned with the programme's learning outcomes. They provide constructive feedback and feedforward to support student growth. At key progression points, examiners review learners' portfolios of evidence to determine their readiness to advance and ensure consistent development in line with NLQF level 7 expectations.
- Programme Management is in charge of keeping the participants engaged and informed of all faculty news, updates and events. They are also the first point of contact for the participants when they need assistance especially at the administrative level. They will be easily available on the institute's instant communication platform. This role is also responsible for organising Town Hall meetings with students and faculty.
- Career coaching by recruitment professionals: in the voluntary talent accelerator services, the participants are planned to be provided with career coaching to get career advice and improve their resumes and data science/AI profiles.

The learners in the programme will be kept well-informed about the curriculum, procedures, requirements and expectations. Information regarding the programme details are provided in the Educational Handbook ([Appendix 7](#)). Further details about each module, its content and assessments can be found in the [Module Descriptions](#) Folder. All documents will be all available to the participants after their enrolment through the learning management system on Canvas. For further guidance and transparency on the module details, the programme participants will receive a

weekly announcement about the agenda including what is expected of them, the assignment or the workshop of the week. The institute website will also provide information on the learning model, the target competencies, brief module descriptions, admissions and the faculty.

The participants will get timely notifications and updates through various channels (the learning management system, e-mail or the institute's instant communication platform Slack) when there is an update on a policy or the faculty makes an academic or an administrative decision. The programme team is responsible for preparing and updating the official guides and documents, and making them available to all community members. The programme team will ensure that the code of conduct will be available to all learners. The program management team will get together regularly to discuss academic progress, curriculum planning and student progress, and update documents where necessary.

2.8 Accessibility

Ensuring an easily accessible, pleasant study experience to all participants is an important element during the learning experience. The learning environment and the materials are designed in a way that facilitates this. For instance, the learning management system used by the institute (Canvas LMS) has a high level of digital accessibility standards that can also be found in this [Appendix 14](#). The campus is accessible with barrier-free facilities that accommodate students with physical disabilities

2.9 The Rights and Responsibilities of the Community Members

At Team Academy, our community thrives on participation, accountability, collaboration, and care: the values that define how we work, learn, and grow together.

Rights:

Every community member has the right to:

- Learn and work in a respectful, inclusive, and safe environment, regardless of race, gender or backgrounds.
- Express ideas and participate in open dialogue where every voice matters.
- Receive fair guidance, feedback, and opportunities for growth.
- Be treated with dignity, transparency, and care by all members of the community.

Responsibilities:

Each member also carries the responsibility to:

- Take ownership of their actions and learning, acting with integrity and purpose.
- Contribute actively to the team and support the growth of others.
- Foster collaboration and co-creation through dialogue and participation.
- Demonstrate courage, care, and accountability in all interactions.

Together, we lead through responsibility, collaboration, and impact to create a culture where leadership is shared, learning is relational, and our collective intelligence drives meaningful change.

Standard 3: Assessment

The programme has an adequate system of assessment in place. The assessments are valid, reliable, and sufficiently independent. The assessment criteria are clear to students. The quality of testing and examination is sufficiently safeguarded and meets legal standards. The assessments support the student's individual learning process. The examination board performs its statutory duties and responsibilities.

Vision on Assessment

As outlined in the *Educational Handbook* and the *Policy on Assessment* (see [Appendix 15](#)), the programme adopts a competency-based learning model implemented through a programmatic assessment structure. Assessment is designed as a continuous and integrated process in which evidence of learning is systematically collected and interpreted to evaluate the learner's progress towards the programme learning outcomes described under Standard 1. The structure distinguishes between low, medium, and high stake assessments to ensure proportionality and coherence across the learning journey. Low-stake activities focus more on formative feedback and self-reflection - do not count towards learning mastery scores, medium-stake assessments provide formal indications of competence development, and high-stake evaluations determine overall achievement of learning outcomes at the end of certain milestones. By combining multiple forms of assessment, both individual and team-based, the framework supports continuous feedback, encourages resubmission and improvement, and ensures that learning is measured holistically through demonstration of progressive mastery rather than isolated performance. More details can be found in the Policy on Assessment.

The assessment policy was created to establish a facilitating infrastructure, which assures both the realisation of the programme outcomes as well as a transparent, reliable, valid and feasible system of assessment. The policy is linked to the institute's overall quality assurance and built on best international practices as well as on various common standards as introduced by [Vereniging van Hogescholen](#) and the NVAO. It outlines the systematic approach relating to all aspects of assessment including all the actors involved. Also, please see the "*Roles in the Process*" table in the Assessment Policy document for more information regarding the role descriptions in the assessment cycle.

A prominent position within a competency-based programmatic assessment is reserved for the use of rubrics, which are all connected to the competencies & learning outcomes and display the evaluation criteria with a certain range. Rubrics establish clarity for assessors and above all for learners about what they are learning and why they are learning it. When our learners receive their written instructions for an assignment, they can see on the same page which reevaluation criteria linked with each learning outcome will be used to assess them. The rubric also provides transparency in the evaluation process both for assessor and learner. An example of a rubric together with the project descriptions can be found in [Appendix 16](#). This excel document also lays out the alignment between the learning outcomes and the modules, and then provides various examples of assessment at medium and high-stake levels.

During the programme, learners continuously receive low and medium-stake assignments which they can revisit (also after evaluation) within the duration of the modules. They are thus challenged to increase their mastery of the topic and (re-)submit their work within a set time frame. Also, they can benefit from peer learning and peer feedback in the team-projects, which offer the opportunity to reflect on and assess their own and their peer's team effort through standardised rubrics. The benefit of this entire system is that it aims to stimulate self-directed learning, as well as feedforward their learning.

Summative decision-making

High-stakes decisions are made at the end of each certification, through a portfolio review and a Viva meeting with each student held by a panel.

- Portfolio: Learners will be expected to curate a digital portfolio composed of medium-stake learning evidence (code repositories, project artefacts, reflective accounts etc) that

demonstrates mastery of every learning outcome. Each learning outcome should be supported by at least three pieces of low-stake, two pieces of medium-level learning evidence. Because evidence builds cumulatively, students can continue to improve or add artefacts for specific skills in subsequent certifications, embodying a growth-mindset approach. The evaluation criteria for the portfolio review can be found in the Appendix 16 in [this sheet](#)

- **Viva Meetings:** Face-to-face meeting during the Viva Week at the end of each certification, held before a panel of three examiners (one applied AI faculty, one applied research faculty and one internal independent faculty). Using a rubric, the panel will assess the depth of understanding, application in practice, and reflective capacity. The panel will reach a consensus verdict of Pass, Conditional Pass or Fail. More details on the VIVA flow and evaluation criteria that apply can be found in the Appendix 16 in [this sheet](#).

Here are the exact high-stake / summative decision points:

End of Certificate 1: AI Foundations & Self-Leadership Inquiry

Evidence: Portfolio of low and medium-stake assessment evidence

Decision: Viva 1 panel verdict

End of Certificate 2: Advanced AI & Interpersonal Leadership Inquiry

Evidence: Portfolio of low and medium-stake assessment evidence

Decision: Viva 2 panel verdict

End of Certificate 3: Responsible AI in Production & Organisational Leadership Inquiry

Evidence: Portfolio of low and medium-stake assessment evidence

Decision: Viva 3 panel verdict; successful candidates are allowed to progress to the Final Project phase.

Final Project: The Final Project is an obligatory component for the programme participants to graduate. Individually, they must submit an original piece of work in which they are required to showcase all the knowledge and skills they acquired during the programme. The *final project procedure and how the evaluation is carried out* can be found in [Appendix 17](#) - Graduation / Final Project Guidelines. For the participants to successfully graduate they must pass each of the criteria at the sufficient level.

Quality safeguarding

The Examination Board maintains oversight of the entire programmatic-assessment cycle. It approves rubrics, calibrates examiner judgements, appoints assessors and reviews Viva recordings to ensure inter-rater reliability. Annual reports demonstrate compliance with Dutch WHW requirements and ESG guidelines.

Certificates of achievement / Diploma

Learners who successfully pass each certification will be issued a certificate of achievement. Graduates of the programme will receive a diploma, an academic transcript and a diploma supplement. According to the Dutch rules and guidelines, the diploma contains the standard information such as the issuer, the programme completed and the date of graduation. The diploma

supplement contains information confirming the type and the level of qualification awarded, the institute issuing the qualification, the content of the programme and the mastery gained.

Portfolio

The programme is designed in such a way that participants graduate with a portfolio, which displays evidence of their mastery in the target competencies. A portfolio can contain different types of learning evidence such as a showcase project, a presentation or a self-reflective account. Portfolios can be hosted by a platform that the institute recommends or elsewhere, depending on the learner's future career goals and what the potential employers are looking for. Portfolios are also an excellent way of showcasing learning mastery if and when a potential employer wishes to see it.

Quality Assurance through the Examination Board

The programme has established an Examination Board operating under the Dutch Law on Higher Education (WHW framework), incorporating common practices as defined by law. The board aims to ensure that the Institute's Assessment Policy and the programme's Teaching and Examination Regulations in [Appendix 19](#) are in place and of a sufficient quality at the implementation level. The Board is chaired by an external qualified member with SKE qualification to safeguard the independence and monitoring of the quality of the learning and the diplomas. For the present composition of the Examination Board and more information on their professional and educational background, please see [Appendix 9](#).

The Examination Board has its Internal Rules and Guidelines which can be found [here](#).

Standard 5: Facilities

The housing and material facilities are sufficient for the implementation of the programme. The facilities and housing are aligned with the intended learning outcomes and the teaching and learning environment.

Physical Environment

Team Academy makes use of its campus facilities in Amsterdam to support the full-time programme experience. The campus comprises approximately 780 square metres distributed across two floors and is designed to facilitate collaborative, student-centred, and practice-oriented learning.

The physical facilities include five classrooms, a library, three office spaces, a dedicated social space, and a multifunctional meeting room suitable for workshops, coaching sessions, project work, and group meetings. The layout and accessibility of the campus provide ample opportunities for interaction between learners and faculty, which supports both formal learning activities and informal knowledge exchange.

The campus is strategically located next to a metro station, with close proximity to two major train stations and Schiphol Airport, and ensures excellent accessibility for both students and staff. The surrounding area offers a wide range of student housing options, as well as nearby restaurants and amenities contributing to a supportive and attractive learning environment.

Digital learning and teaching environment

In addition to its campus, the learning and teaching environment is also built on top-notch digital platforms where every learner has seamless access to all educational resources, materials, activities, assignments and events. These digital platforms consist of the learning management system as well

as the communication and interaction tools helping to keep all resources and materials organised. The programmes are planned to be delivered on the institute's Learning Management System built on Canvas LMS. Communication systems (e.g. chat bots and instant messaging platforms such as Slack) are in place for an efficient flow of communication between all community members including learners, management teams, boards, faculty and employer partners. All online synchronous interactions are planned to be conducted on live video conferencing tools allowing for group interaction and participation such as Zoom and Google Meet.

Learners will have access to a digital content library consisting of a variety of learning resources in each programme. Each module in the programme will be supported by a large content library of videos and books, industry-driven projects and teaching materials during the workshops. The content library is composed of several online learning platforms such as Datacamp.

Together, the digital and physical facilities provide a coherent and well-aligned infrastructure that supports the programme's intended learning outcomes and enables an effective, engaging, and professionally relevant teaching and learning environment.

Standard 6: Quality Assurance

The programme has an explicit and broadly supported system of quality assurance, promotes a culture of quality, and is focused on development. The programme organises effective and periodic feedback activities that support the achievement of the intended learning outcomes. In existing programmes, appropriate improvements are implemented based on the outcomes of the previous assessment. Appropriate evaluation and measurement tools are used for this purpose. The results of these evaluations demonstrably form the basis for development and improvement. The programme reports internally on its contribution to achieving the institution's strategic goals. Quality assurance ensures the achievement of the intended learning outcomes. Programme committees, examination boards, staff, students, alumni, and the professional field are actively involved in the internal quality assurance system. The design processes, as well as the recognition and assurance of the programme's quality, comply with the ESG (European Standards and Guidelines). The programme publishes accurate, reliable, and easily accessible information for all target groups regarding the quality of the programme.

Quality assurance is needed to ensure the sustainability of an institute's quality standards. To ensure an increased academic quality of the programmes, Team Academy carries out Internal and External Quality Assurance.

Internal Quality Assurance

We strive to ensure continuous improvement in collaboration with faculty, participants and external partners. Quality assurance is not an end in itself, but rather a means to an end. It is a comprehensive concept which involves the evaluation and improvement of all elements from the learning outcomes, content, assessment procedures, staff development to learner success and employability. It is driven by two main questions:

- How do we know we are doing the right thing?
- What do we do with the knowledge to improve what we do?

The Quality Assurance (QA) team is in charge of managing the overall quality of the educational programme. This is being done by collecting data, reviewing the results and taking the necessary actions based on the results. The QA team is composed of a QA team lead and the programme management who meet regularly at regular check-ins for improvements in the programme. The QA team regularly reports to the institute's Executive Board for any QA improvement needs, decisions or systemic changes. Below, different levels of internal quality insurance is described:

- (1) The Activity Level involves the quality standards of the weekly workshops, coaching services, digital content, assignments/projects. First, for standardisation and increased quality of the weekly workshops, facilitators will be provided professional development opportunities where necessary. Second, the weekly reflections and feedback collected during Town Halls will play an important role in the iterative improvement process at Team Academy.
- (2) The Module Level includes reviewing the extent to which the procedures regarding the module objectives are fulfilled. At the end of each module, which takes about 4- 5 weeks, the learners will be invited to reflect on their experience, learning and skills development in a written reflective account.
- (3) The Certification Level includes a review by programme management and faculty of the extent to which the certification's objectives were fulfilled, what went well and what could have been better, as well as possible action items for improving the experience and the academic quality. This is planned to take place in a form of formal evaluations taking place at the end of each certification. These evaluations will offer us qualitative data and a step-by-step insight into the programme's perceived success. It will also tell us what could be improved from a student perspective.
- (4) The Programme Level where the Institute's main objective is to ensure that the intended objectives of the programme are fulfilled. In order to measure this and maintain the desired academic profile of the programme, we take the extent to which the programme helps participants achieve the desired development in their knowledge and skills into account by focussing on an objective show of learning mastery by evaluating the quality of students' digital portfolios which include their AI projects and their final project.

Stakeholders will be actively involved at each level of the internal quality assurance process. At the activity and module levels, learners will provide insights through reflections and Town Halls. At the certification level, the programme manager, relevant faculty jointly review outcomes during the evaluation sessions. At the programme level, the curriculum team comprising the programme manager, curriculum lead, and faculty evaluate overall programme effectiveness and alignment with intended learning outcomes. This collaborative structure ensures that quality improvement is informed by those directly engaged in the delivery and development of the programme.

Team Academy has developed a comprehensive quality assurance policy that complies with the requirements of the "European Standards and Guidelines for Quality Assurance in the European Higher Education Area" (ESG). Please see the Quality Assurance Policy [here](#) in [Appendix 21](#).

External Quality Assurance

The Team Academy programmes put a deliberate effort in raising its academic standards through programme accreditations across Europe. We are currently seeking accreditation by NVAO and further international accreditation afterwards. This means we are taking into account the quality criteria of the NVAO standards and aim to become a part of this system of quality assurance. We also have NRTTO membership. As part of the quality assurance, we are in close contact with field experts and employers whose market insights help us improve the quality of the programmes. We regularly check the needs of the industry and adapt the curriculum accordingly. To this end, as Team Academy we organise the following activities:

- Employer Meetups: Events to connect participants with potential employers or recruiters.

- Workshops with Field Experts which help us to meet with professionals and gather insights from the field.
- Tech Minds Series: A series of events such as summits and webinars focused on key topics such as Data Science, AI, and Software Engineering. Each summit brings together industry experts to share insights, trends, and practical knowledge. This helps us stay connected and updated with industry.

The programme has been designed and developed according to rigorous academic and professional standards, with input from industry partners to ensure strong labour-market alignment. While this groundwork provides a solid foundation for first-time delivery, we will remain committed to systematic reflection and improvements. By regularly collecting and analysing feedback from learners, faculty, and the professional field, we will implement timely enhancements so that the programme keeps pace with emerging developments and consistently advances learner growth and success.
